

Leonardo ENERGY Offers Energy Management Foundation Training

An online course is being offered to energy managers with an interest in improving their organisation's energy performance and implementing an energy management system. The training takes participants through the energy management cycle using ISO 50001 as a basis, and also offers opportunities to network and interact with peers.

The course is free to join, and is structured into nine chapters that work through managerial roles, energy review and planning, implementation of a management system and verification of performance improvement.

Around 400 participants from around Europe are currently working through the course, which offers a forum for interaction where questions can be posed to experts as well as peers being confronted with the same issues.

For more details, and to register, visit www.leonardo-academy.org/course and select Energy Management Foundation Training.

About Leonardo ENERGY

The Leonardo Energy initiative (LE) unites professionals from all over the world dedicated to electrical power and sustainable energy. It is managed by the European Copper Institute in close cooperation with its partners.

LE was established from growing understanding that copper is essential in achieving sustainability. Its high electrical conductivity is a favourable attribute for the construction of renewable energy systems and the manufacturing of energy efficient motors, transformers, and cables.

The principal aim of LE is to accelerate the transition to a sustainable energy economy. It provides free education, training, and the comprehensive exchange of expertise. It is also active in various standardisation committees and provides regulatory advice.
